Dear authors, readers and reviewers,

It is my great honor and pleasure to let you know that the International Journal of Nanotechnology in Medicine & Engineering (IJNME) has taken off this past October, and already published the first and second issues of its short life.

The aim of this open access journal is to fill a major gap in the nanotechnology literature, providing a single source of both theoretical and experimental research papers for the life sciences and other engineering fields. The journal's primary objective is to provide an international visibility for state-of-the-art research and outstanding developments in nanoscience.

IJNME publishes a variety of papers, including original research articles, review articles, clinical review articles, practice articles, editorials, short communications, case reports, blogs, clinical management guidelines, research methods and reporting articles in essentially all areas of Nanotechnology, therefore it seamlessly connects experts from all around this multidisciplinary and exciting industry.

As we are quite fresh maneuvering in the vast landscape of nanotech journals and other related content providers we can only succeed with your help providing us with top-quality submissions. At this point, our major focus is on supporting your work via providing high transparency to it among your peers who has no or limited access to library articles. On my side, I will do what it takes to promote the journal through social media and by other creative means, because I strongly believe that sharing your work with people who care and positively influence them is not just the ultimate reward of doing research, but it should be the main cause of it too. Therefore, I will do my best to make sure to maximize the reach-out of this journal!

We, of course, welcome any input and suggestions along the road, so I would urge you all to make yourself heard!

Krisztian Niesz
